Space heaters provide heat to control heating system using water for increasing and maintaining your home temperature. Choosing an energy efficiency heating system for your home is an effective way to significantly reduce the cost of your energy bill. This guide will help you make an informed and energy-efficient purchase.

**Heating efficiency**
Space heaters are just one component of your home’s heating system. As not every heater will fit into your home, you must consider whether the heater is compatible with other heating components you might be using.

Properly installing a heater is a task best left to a skilled craftsman. In fact, an incorrect installation may actually increase your energy demand and even create safety risks!

Choosing an energy efficient heater can lower your energy costs significantly. If your home is equipped with a conventional gas-boiler using 20 MWh of energy per year, a new condensing gas-boiler can save you 275 € per year. In other words, the amount you save on energy will cover the cost of your new boiler in just seven years.

**Shopping for your space or combination heater**
The broad variety of space and combination heaters available on the market means you can select from a wide range of efficiencies.

So how do you choose?
After you narrow down your options to the products that best meet your needs, the next step is to compare and see which is the most efficient. To do this, make sure the product’s energy efficiency label’s colour band is at least green.

To help, here are some tips:

Reading the space and combination heater labels
Each heater will come with an energy label showing its energy efficiency on a scale from A++ (most efficient) to G (least efficient). There are labels for boiler, cogeneration, heat pump and low temperature heat pump space heaters. Furthermore, there is a separate label for packages that combine these space heaters with solar energy and temperature control (see p. 2).

Despite this broad variety of labels, they all follow a common scheme that is quite simple to understand.

1. The company that made or placed the heater on the market
2. The model of the heater
3. The type of product is indicated by a symbol either showing a radiator, tap or water tank
4. The heater’s maximum indoor sound level
5. The heater’s maximum outdoor sound level
6. Boiler combination heaters able to work only during off-peak hours
7. The heater has an additional electricity generation function
8. European temperature map displaying three indicative temperature zones
Heat pumps label
The overall performance with the efficiency rating (up to A++) is differentiated according to the flow temperature of the heating system. If a low temperature system is used, the performance is usually higher.

To achieve this efficiency, your heating system must be capable of handling low temperature flows!
The performance of a heat pump also depends on the climate of the region you live. The heat output for the area you live is shown on the map in the lower right corner.

Combination heaters label
For heaters that include hot water generation, two additional labels are available:
• Boiler combination heaters
• Heat pump combination heaters
For information on water heating, please refer to the Consumer’s Guide to Energy-Efficient Water Heaters.

Tips on space and combination heater
• Refer to your dealer or installer’s expertise in choosing the right product for your home.
• Read the label: An A or higher rating means the heater is one of the most efficient heaters on the market and can therefore reduce running costs. You can increase your energy-saving advantages by combining different technologies: you can even reach an A+++ rating!
• Consider the noise level: The amount of noise a heater makes while operating is rated in decibels (dB). To give you some idea of what the scale means, a conversation at home is rated at 50 dB and a motor-cycle at 100 dB.
• Check your indoor temperature. An increase of 1°C will increase your energy bill by 7%.
• Ideally, ventilate your home with open windows twice a day for 5 to 10 minutes. Keep your windows closed the rest of the time during the heating season.
• Use your heating controls to adapt the temperature levels to your presence. For instance, when not at home, you may want to slightly decrease the temperature.

Reading the space and combination heater package labels
For combinations of different components, your dealer will provide an individual label, of which two variants exist:
• Packages of space heater, temperature control and solar device;
• Packages of combination heater, temperature control and solar device.

1. The package includes a solar collector
2. The package includes a hot water storage tank
3. The package includes temperature control
4. The package includes a supplementary heater

Only with a combination of the different technologies can you achieve the A+++ rating. Please note that such a combination must be planned and installed properly.
